MCF51JM128

MCF51JM128 ColdFire Microcontroller

The MCF51JM128 is a member of the ColdFire[®] family of 32-bit reduced instruction set computing (RISC) microprocessors. This document provides an overview of the MCF51JM128 series, focusing on its highly integrated and diverse feature set.

The MCF51JM128 series is based on the V1 ColdFire core and operates at processor core speeds up to 50.33 MHz. As part of Freescale's Controller Continuum[®], it is an ideal upgrade for designs based on the MC9S08JM60 series of 8-bit microcontrollers.

The MCF51JM128 features the following functional units:

- V1 ColdFire core with background debug module
- Up to 128 KBytes of flash memory
- Up to 16 Kbytes of static RAM (SRAM)
- Multipurpose clock generator (MCG)
- Dual-role Universal Serial Bus On-The-Go device (USBOTG)
- Controller-area network (MSCAN)
- Cryptographic acceleration unit (CAU)
- Random number generator accelerator (RNGA)
- Analog comparators (ACMP)
- Analog-to-digital converter (ADC) with up to 12 channels
- Two Inter-integrated circuit (IIC) modules
- Two serial peripheral interfaces (SPI)
- Two serial communications interfaces (SCI)
- Carrier modulation timer (CMT)
- Eight-channel timer/pulse-width modulators (TPM)
- Real-time counter (RTC)
- 66 general-purpose input/output (GPIO) modules plus Interrupt request input
- Eight keyboard interrupts (KBI)
- 16-bit Rapid GPIO

44 LQFP 10 mm × 10 mm 14 mm × 14 mm

MCF51JM128 ColdFire Microcontroller, Rev. 3

MCF51JM128 Family Configurations

 $^{2}\,$ Up to 16 pins on Ports A, H, and J are shared with the ColdFire Rapid GPIO module.

1.2 Block Diagram

Figure 1 shows the connections between the MCF51JM128 series pins and modules.

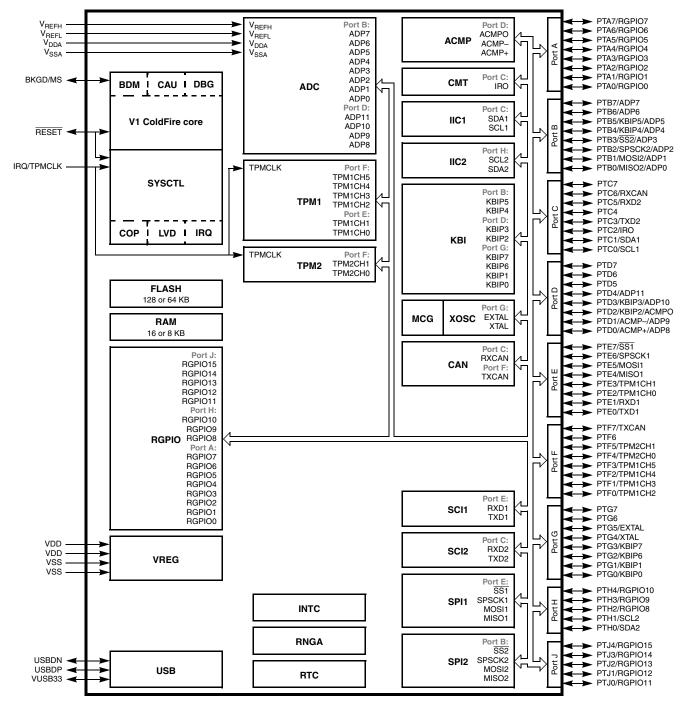

Figure 1. MCF51JM128 Block Diagram

1.3 Features

Table 2 describes the functional units of the MCF51JM128 series.

Table 2. MCF51JM128 Series Functional Units

Unit	Function
CF1CORE (V1 ColdFire core)	Executes programs and interrupt handlers
BDM (background debug module)	Provides a single-pin debugging interface (part of the V1 ColdFire core)
DBG (debug)	Provides debugging and emulation capabilities (part of the V1 ColdFire core)
SYSCTL (system control)	Provides LVD, COP, external interrupt request, and so on
FLASH (flash memory)	Provides storage for program code and constants
RAM (random-access memory)	Provides storage for program code, constants, and variables
RGPIO (rapid general-purpose input/output)	Allows I/O port access at CPU clock speeds
VREG (voltage regulator)	Controls power management throughout the device
USBOTG (USB On-The-Go)	Supports the USB On-The-Go dual-role controller
ADC (analog-to-digital converter)	Measures analog voltages at up to 12 bits of resolution
TPM1, TPM2 (timer/pulse-width modulators)	Provide a variety of timing-based features
CF1_INTC (interrupt controller)	Controls and prioritizes all device interrupts
CAU (cryptographic acceleration unit)	Co-processor support for DES, 3DES, AES, MD5, and SHA-1
RNGA (random number generator accelerator)	32-bit random number generator that complies with FIPS-140
RTC (real-time counter)	Provides a constant-time base with optional interrupt
ACMP (analog comparator)	Compares two analog inputs
CMT (carrier modulator timer)	Infrared output used for the Remote Controller
IIC1, IIC2 (inter-integrated circuits)	Supports the standard IIC communications protocol
KBI (keyboard interrupt)	Provides pin interrupt capabilities
MCG (multipurpose clock generator)	Provides clocking options for the device, including a phase-locked loop (PLL) and frequency-locked loop (FLL) for multiplying slower reference clock sources
XOSC (crystal oscillator)	Supports low/high range crystals
CAN (controller area network)	Supports standard CAN communications protocol
SCI1, SCI2 (serial communications interfaces)	Serial communications UARTs that can support RS-232 and LIN protocols
SPI1, SPI2 (serial peripheral interfaces)	Provide a 4-pin synchronous serial interface

MCF51JM128 Family Configurations

1.3.1 Feature List

- 32-Bit Version 1 ColdFire® Central Processor Unit (CPU)
 - Up to 50.33 MHz at 2.7 V 5.5 V
 - Performance (Dhrystone 2.1):
 - 0.94 Dhrystone 2.1 MIPS per MHz when running from internal RAM
 - 0.76 Dhrystone 2.1 MIPS per MHz when running from flash
 - Implements Instruction Set Revision C (ISA_C)
 - Supports up to 30 peripheral interrupt requests and seven software interrupts
- · On-chip memory
 - Up to 128 KBytes Flash memory with read/program/erase over full operating voltage and temperature range
 - Up to 16 KBytes static random access memory (RAM)
 - Security circuitry to prevent unauthorized access to RAM and flash contents
- · Power-saving modes
 - Two low-power stop plus wait modes
 - Peripheral clock enable register can disable clocks to unused modules, thereby reducing currents; this behavior allows clocks to remain enabled to specific perhipherals in Stop3 mode
 - Very lower power real-time counter for use in run, wait, and stop modes with internal and external clock sources
- Four Clock Source Options
 - Oscillator (XOSC) Loop-control Pierce oscillator; crystal or ceramic resonator range of 31.25 kHz to 38.4 kHz or 1 MHz to 16 MHz
 - FLL/PLL controlled by internal or external reference
 - Trimmable internal reference allows 0.2% resolution and 2% deviation
- System protection features
 - Watchdog computer operating properly (COP) reset with option to run from dedicated 1 kHz internal clock source or bus clock
 - Low-voltage detection with reset or interrupt; selectable trip points
 - Illegal opcode and illegal address detection with programmable reset or exception response
 - Flash block protection
- Debug support
 - Single-wire Background debug interface
 - 4 Program Counters plus two address (optional data) breakpoint registers with programmable 1- or 2-level trigger response
 - 64-entry processor status and debug data trace buffer with programmable start/stop conditions
- Universal Serial Bus (USB) On-The-Go dual-role controller
 - Full-speed USB device controller
 - Fully compliant with USB specification 1.1 and 2.0
 - 16 bidirectional endpoints, with double buffering to provide the maximum throughput
 - Supports control, bulk, interrupt, and isochronous endpoints
 - Supports bus-powered capability with low-power consumption
 - Full-speed / low-speed host controller
 - Host mode allows control, bulk, interrupt, and isochronous transfers
 - OTG protocol logic

6

- On-chip USB transceiver
- On-chip 3.3 V USB regulator and pull-up resistors save system cost

- Controller area network (MSCAN)
 - Implementation of the CAN protocol Version 2.0A/B
 - Five receive buffers with FIFO storage scheme
 - Three transmit buffers with internal prioritization using a "local priority" concept
 - Flexible maskable identifier filter programmable as 2x32-bit, 4x16-bit, or 8x8-bit
 - Programmable wakeup functionality with integrated low-pass filter
 - Programmable loopback mode supports self-test operation
 - Programmable bus-off recovery functionality
 - Internal timer for time-stamping of received and transmitted messages
- Cryptographic acceleration unit (CAU)
 - Co-processor support of DES, 3DES, AES, MD5, and SHA-1
- Random number generator accelerator (RNGA)
 - 32-bit random number generator that complies with FIPS-140
- Analog-to-digital converter (ADC)
 - 12-channel, 12-bit resolution
 - Output formatted in 12-, 10-, or 8-bit right-justified format
 - Single or continuous conversion, and selectable asynchronous hardware conversion trigger
 - Operation in Stop3 mode
 - Automatic compare function
 - Internal temperature sensor
- Analog comparators (ACMP)
 - Selectable interrupt on rising edge, falling edge, or either rising or falling edges of comparator output
 - Option to compare to fixed internal bandgap reference voltage
 - Option to route output to TPM module
 - Operation in Stop3 mode
- Inter-integrated circuit (IIC)
 - Up to 100 kbps with maximum bus loading
 - Multi-master operation
 - Programmable slave address
 - Supports broadcast mode and 10-bit address extension
- Serial communications interfaces (SCI)
 - Two SCIs with full-duplex, non-return-to-zero (NRZ) format
 - LIN master extended break generation
 - LIN slave extended break detection
 - Programmable 8-bit or 9-bit character length
 - Wake up on active edge
- Serial peripheral interfaces (SPI)
 - Two serial peripheral interfaces with full-duplex or single-wire bidirectional
 - Double-buffered transmit and receive
 - Programmable transmit bit rate, phase, polarity, and Slave Select output
 - MSB-first or LSB-first shifting
- Timer/pulse width modulator (TPM)
 - 16-bit free-running or modulo up/down count operation
 - Up to eight channels, where each channel can be an input capture, output compare, or edge-aligned PWM
 - One interrupt per channel plus terminal count interrupt

MCF51JM128 Family Configurations

- RTC
 - 8-bit modulus counter with binary- or decimal-based prescaler
 - External clock source for precise time base, time-of-day, calendar or task scheduling functions
 - Free running on-chip low power oscillator (1 kHz) for cyclic wake-up without external components
- Carrier modulator timer (CMT)
 - carrier generator, modulator, and transmitter drive the infrared out (IRO) pin
 - operation in independent high/low time control, baseband, FSK, and direct IRO control modes
- Input/Output
 - 66 GPIOs
 - Eight keyboard interrupt pins with selectable polarity
 - Hysteresis and configurable pull-up device on all input pins; configurable slew rate and drive strength on all output pins
 - 16 bits of Rapid GPIO connected to the processor's local 32-bit platform bus with set, clear, and faster toggle functionality

This section contains electrical specification tables and reference timing diagrams for the MCF51JM128 microcontroller, including detailed information on power considerations, DC/AC electrical characteristics, and AC timing specifications.

The electrical specifications are preliminary and are from previous designs or design simulations. These specifications may not be fully tested or guaranteed at this early stage of the product life cycle. These specifications will, however, be met for production silicon. Finalized specifications will be published after complete characterization and device qualifications have been completed.

NOTE

The parameters specified in this data sheet supersede any values found in the module specifications.

2.1 Parameter Classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding the following classification is used and the parameters are tagged accordingly in the tables where appropriate:

Table 5. Parameter Classifications

Р	Those parameters are guaranteed during production testing on each individual device.
С	Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations.
Т	Those parameters are achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted. All values shown in the typical column are within this category.
D	Those parameters are derived mainly from simulations.

NOTE

The classification is shown in the column labeled C in the parameter tables where appropriate.

2.2 Absolute Maximum Ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the limits specified in Table 6 may affect device reliability or cause permanent damage to the device. For functional operating conditions, refer to the remaining tables in this section.

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, V_{SS} or V_{DD}).

Rating	Symbol	Value	Unit
Supply voltage	V_{DD}	-0.3 to 5.8	V
Input voltage	V _{In}	-0.3 to $V_{DD} + 0.3$	V
Instantaneous maximum current Single pin limit (applies to all port pins) ¹ , ² , ³	I _D	±25	mA
Maximum current into V _{DD}	I _{DD}	120	mA
Storage temperature	T _{stg}	-55 to 150	°C
Maximum junction temperature	T _J	150	°C

Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive (V_{DD}) and negative (V_{SS}) clamp voltages, then use the larger of the two resistance values.

2.3 Thermal Characteristics

This section provides information about operating temperature range, power dissipation, and package thermal resistance. Power dissipation on I/O pins is usually small compared to the power dissipation in on-chip logic and it is user-determined rather than being controlled by the MCU design. To take $P_{I/O}$ into account in power calculations, determine the difference between actual pin voltage and V_{SS} or V_{DD} and multiply by the pin current for each I/O pin. Except in cases of unusually high pin current (heavy loads), the difference between pin voltage and V_{SS} or V_{DD} is small.

Table 7. Thermal Characteristics

Rating		Symbol	Value	Unit
Operating temperature range (packaged)		T _A	-40 to 105	°C
Thermal resistance ^{1,2,3,4}				
80-pin LQFP				
	1s		52	
	2s2p		40	
64-pin LQFP				
	1s		65	
	2s2p	$\theta_{\sf JA}$	47	°C/W
64-pin QFP				
	1s		54	
	2s2p		40	
44-pin LQFP				
	1s		69	
	2s2p		48	

Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.

 $^{^{2}}$ All functional non-supply pins are internally clamped to V_{SS} and V_{DD} .

Power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current conditions. If positive injection current (V_{In} > V_{DD}) is greater than I_{DD}, the injection current may flow out of V_{DD} and could result in external power supply going out of regulation. Ensure external V_{DD} load shunt current is greater than maximum injection current. This is the greatest risk when the MCU is not consuming power. Examples: if no system clock is present or if the clock rate is low, which would reduce overall power consumption.

Junction to Ambient Natural Convection

The average chip-junction temperature (T_J) in °C can be obtained from:

$$T_{J} = T_{A} + (P_{D} \times \theta_{JA})$$
 Eqn. 1

where:

 T_A = Ambient temperature, ${}^{\circ}C\theta_{JA}$ = Package thermal resistance, junction-to-ambient, ${}^{\circ}C/WP_D$ = P_{int} + $P_{I/O}P_{int}$ = $I_{DD} \times V_{DD}$, Watts — chip internal power $P_{I/O}$ = Power dissipation on input and output pins — user determined

For most applications, $P_{I/O} \ll P_{int}$ and can be neglected. An approximate relationship between P_D and T_J (if $P_{I/O}$ is neglected) is:

$$P_D = K \div (T_J + 273^{\circ}C)$$
 Eqn. 2

Solving equations 1 and 2 for K gives:

$$K = P_D \times (T_A + 273^{\circ}C) + \theta_{JA} \times (P_D)^2$$
 Eqn. 3

where K is a constant pertaining to the particular part. K can be determined from equation 3 by measuring P_D (at equilibrium) for a known T_A . Using this value of K, the values of P_D and T_J can be obtained by solving equations 1 and 2 iteratively for any value of T_A .

2.4 Electrostatic Discharge (ESD) Protection Characteristics

Although damage from static discharge is much less common on these devices than on early CMOS circuits, normal handling precautions should be used to avoid exposure to static discharge. Qualification tests are performed to ensure that these devices can withstand exposure to reasonable levels of static without suffering any permanent damage.

All ESD testing is in conformity with CDF-AEC-Q00 Stress Test Qualification for Automotive Grade Integrated Circuits. (http://www.aecouncil.com/) This device was qualified to AEC-Q100 Rev E.

A device is considered to have failed if, after exposure to ESD pulses, the device no longer meets the device specification requirements. Complete DC parametric and functional testing is performed per the applicable device specification at room temperature followed by hot temperature, unless specified otherwise in the device specification.

Table 8. ESD and Latch-up Test Conditions

Model	Description	Symbol	Value	Unit
	Series Resistance	R1	1500	Ω
Human Body	Storage Capacitance	С	100	pF
	Number of Pulse per pin	_	3	
Latch-up	Minimum input voltage limit	_	-2.5	V
Laterrup	Maximum input voltage limit	_	7.5	V

³ 1s - Single Layer Board, one signal layer

⁴ 2s2p - Four Layer Board, 2 signal and 2 power layers

Table 9. ESD and Latch-Up Protection Characteristics

Num	Rating	Symbol	Min	Max	Unit
1	Human Body Model (HBM)	V_{HBM}	±2000	_	V
2	Charge Device Model (CDM)	V _{CDM}	±500	_	V
3	Latch-up Current at T _A = 105°C	I _{LAT}	±100	_	mA

2.5 DC Characteristics

This section includes information about power supply requirements, I/O pin characteristics, and power supply current in various operating modes.

Table 10. DC Characteristics

Num	С	Parameter	Symbol	Min	Typ ¹	Max	Unit

1		(ERCLKEN =1 and EREFSTEN = 1)		DDOSC	3	5	_	μΑ

¹ Typicals are measured at 25°C.

² Values given here are preliminary estimates prior to completing characterization.

³ All modules' clocks are switched on, code runs from flash, in FEI mode, and there are no DC loads on port pins.

⁴ Most customers are expected to find that auto-wakeup from stop2 or stop3 can be used instead of the higher current wait mode.

 $^{^{5}}$ Values given under the following conditions: low range operation (RANGE = 0), low power mode (HGO = 0)

2.7 Analog Comparator (ACMP) Electricals

Table 12. Analog Comparator Electrical Specifications

Num	С	Rating	Symbol	Min	Typical	Max	Unit
1		Supply voltage	V_{DD}	2.7	_	5.5	V

¹ Data in Typical column was characterized at 5.0 V, 25C or is typical recommended value

² The resulting bus clock frequency should not exceed the maximum specified bus clock frequency of the device.

³ This specification applies to any time the FLL reference source or reference divider is changed, trim value changed or changing from FLL disabled (BLPE, BLPI) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.

⁴ This specification applies to any time the PLL VCO divider or reference divider is changed, or changing from PLL disabled (BLPE, BLPI) to PLL enabled (PBE, PEE). If a crystal/resonator is being used as the reference, this specification assumes it is already running.

- Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum f_{BUS}. Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the FLL circuitry via V_{DD} and V_{SS} and variation in crystal oscillator frequency increase the C_{Jitter} percentage for a given interval.
- 6 625 ns represents 5 time quanta for CAN applications, under worst case conditions of 8 MHz CAN bus clock, 1 Mbps CAN bus speed, and 8 time quanta per bit for bit time settings. 5 time quanta is the minimum time between a synchronization edge and the sample point of a bit using 8 time quanta per bit.
- Below D_{lock} minimum, the MCG is guaranteed to enter lock. Above D_{lock} maximum, the MCG will not enter lock. But if the MCG is already in lock, then the MCG may stay in lock.
- ⁸ Below D_{unl} minimum, the MCG will not exit lock if already in lock. Above D_{unl} maximum, the MCG is guaranteed to exit lock.

2.11 AC Characteristics

This section describes ac timing characteristics for each peripheral system.

2.11.1 Control Timing

Table 17. Control Timing

Num	С	Parameter	Symbol	Min	Typ ¹	Max	Unit
1		Bus frequency (t _{cyc} = 1/f _{Bus})	f _{Bus}	dc	_	24	MHz
2		Internal low-power oscillator period	t _{LPO}	700	_	1300	μS
3		External reset pulse width ² (t _{cyc} = 1/f _{Self_reset})	t _{extrst}	100	_	_	ns
4		Reset low drive	t _{rstdrv}	$66 \times t_{cyc}$	_	_	ns
5		Active background debug mode latch setup time	t _{MSSU}	500	_	_	ns
6		Active background debug mode latch hold time	t _{MSH}	100	_	_	ns
7		IRQ pulse width Asynchronous path ² Synchronous path ³	t _{ILIH,} t _{IHIL}	100 1.5 x t _{cyc}	_	_	ns
8		KBIPx pulse width Asynchronous path ² Synchronous path ³	t _{ILIH,} t _{IHIL}	100 1.5 × t _{cyc}	_	_	ns
9		Port rise and fall time (load = 50 pF) ⁴ Slew rate control disabled (PTxSE = 0) High drive Slew rate control enabled (PTxSE = 1) High drive Slew rate control disabled (PTxSE = 0) Low drive Slew rate control enabled (PTxSE = 1) Low drive	^t Rise ^{, t} Fall	_	11 35 40 75	_	ns

Typical values are based on characterization data at V_{DD} = 5.0V, 25°C unless otherwise stated.

MCF51JM128 ColdFire Microcontroller, Rev. 3

² This is the shortest pulse guaranteed to be recognized as a reset pin request. Shorter pulses are not guaranteed to override reset requests from internal sources.

³ This is the minimum pulse width guaranteed to pass through the pin synchronization circuitry. Shorter pulses may or may not be recognized. In stop mode, the synchronizer is bypassed so shorter pulses can be recognized in that case.

 $^{^4}$ Timing is shown with respect to 20% $\rm V_{DD}$ and 80% $\rm V_{DD}$ levels. Temperature range –40°C to 105°C.

Figure 10. Reset Timing

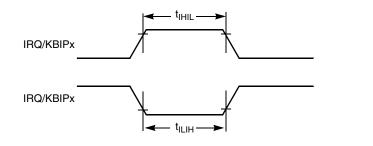

Figure 11. IRQ/KBIPx Timing

2.11.2 Timer/PWM (TPM) Module Timing

Synchronizer circuits determine the shortest input pulses that can be recognized or the fastest clock that can be used as the optional external source to the timer counter. These synchronizers operate from the current bus rate clock.

Table 18. TPM Input Timing

NUM	С	Function	Symbol	Min	Max	Unit
1	_	External clock frequency	f _{TPMext}	dc	f _{Bus} /4	MHz

2.13 Flash Specifications

This section provides details about program/erase times and program-erase endurance for the Flash memory.

Program and erase operations do not require any special power sources other than the normal V_{DD} supply.

Table 21. Flash Characteristics

Num	С	Characteristic	Symbol	Min	Typ ¹	Max	Unit
1		Supply voltage for program/erase	V _{prog/erase}	2.7		5.5	V
2		Supply voltage for read operation	V _{Read}	2.7 5.5		V	
3		Internal FCLK frequency ²	f _{FCLK}	150		200	kHz
4		Internal FCLK period (1/FCLK)	t _{Fcyc}	5		6.67	μS
5		Byte program time (random location) ⁽²⁾	t _{prog}	9			t _{Fcyc}
6		Byte program time (burst mode) ⁽²⁾	t _{Burst}	4			t _{Fcyc}
7		Page erase time ³	t _{Page}	4000			t _{Fcyc}
8		Mass erase time ⁽²⁾	t _{Mass}	20,000			t _{Fcyc}
9	С	Program/erase endurance ⁴ T _L to T _H = -40°C to + 105°C T = 25°C		10,000	 100,000	_	cycles
10		Data retention ⁵	t _{D_ret}	15	100	_	years

 $[\]overline{}^{1}$ Typical values are based on characterization data at $V_{DD} = 5.0 \text{ V}$, 25°C unless otherwise stated.

2.14 USB Electricals

The USB electricals for the USBOTG module conform to the standards documented by the Universal Serial Bus Implementers Forum. For the most up-to-date standards, visit http://www.usb.org.

If the Freescale USBOTG implementation requires additional or deviant electrical characteristics, this space would be used to communicate that information.

² The frequency of this clock is controlled by a software setting.

These values are hardware state machine controlled. User code does not need to count cycles. This information supplied for calculating approximate time to program and erase.

⁴ Typical endurance for Flash was evaluated for this product family on the 9S12Dx64. For additional information on how Freescale Semiconductor defines typical endurance, please refer to Engineering Bulletin EB619/D, *Typical Endurance for Nonvolatile Memory.*

Typical data retention values are based on intrinsic capability of the technology measured at high temperature and de-rated to 25°C using the Arrhenius equation. For additional information on how Freescale Semiconductor defines typical data retention, please refer to Engineering Bulletin EB618/D, Typical Data Retention for Nonvolatile Memory.

Table 22. Internal USB 3.3V Voltage Regulator Characteristics

	Symbol	Unit	Min	Тур	Max
Regulator operating voltage	V _{regin}	V	3.9	_	5.5
VREG output	V _{regout}	V	3	3.3	3.6
Vusb33 input with internal Vreg disabled	V _{usb33in}	V	3	3.3	3.6
VREG Quiescent Current	I _{VRQ}	mA	_	0.5	_

2.15 EMC Performance

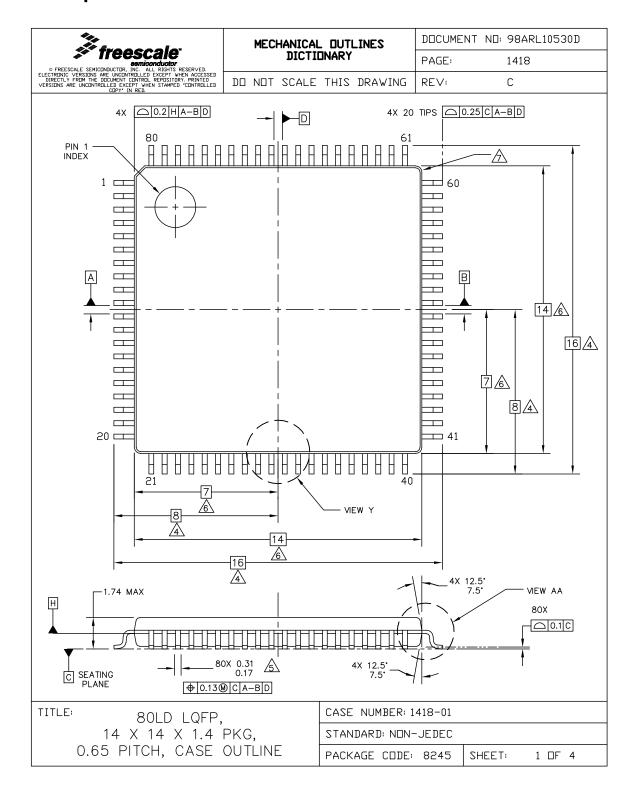

Electromagnetic compatibility (EMC) performance is highly dependant on the environment in which the MCU resides. Board design and layout, circuit topology choices, location and characteristics of external components as well as MCU software operation all play a significant role in EMC performance. The system designer should consult Freescale applications notes such as AN2321, AN1050, AN1263, AN2764, and AN1259 for advice and guidance specifically targeted at optimizing EMC performance.

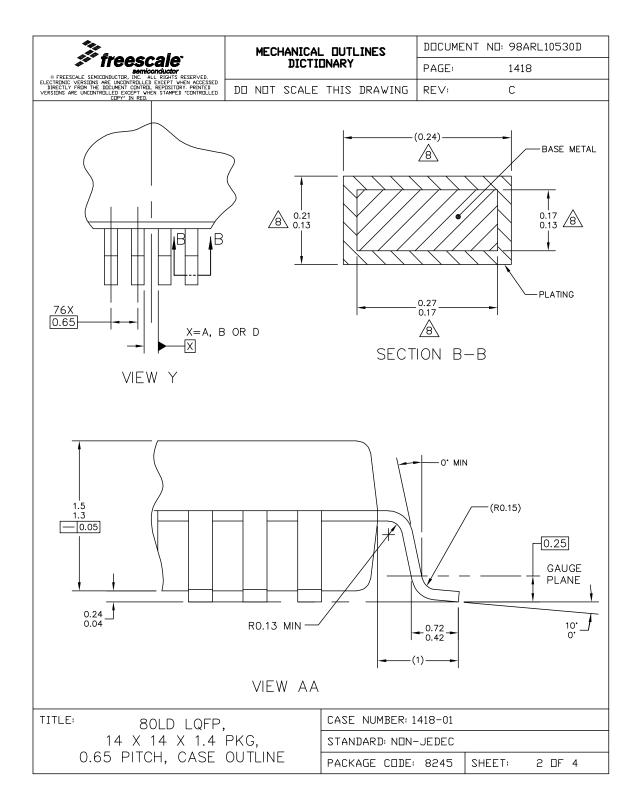

2.15.1 Radiated Emissions

Microcontroller radiated RF emissions are measured from 150 kHz to 1 GHz using the TEM/GTEM Cell method in accordance with the IEC 61967-2 and SAE J1752/3 standards. The measurement is performed with the microcontroller installed on a custom EMC evaluation board while running specialized EMC test software. The radiated emissions from the microcontroller are measured in a TEM cell in two package orientations (North and East). For more detailed information concerning the evaluation results, conditions and setup, please refer to the EMC Evaluation Report for this device.

3 Mechanical Outline Drawings

DO NOT SCALE THIS DRAWING

NOTES:

- 1. DIMENSIONS ARE IN MILLIMETERS.
- 2. DIMENSIONING AND TOLERANCING PER ASME Y14.5M-1994.
- 3. DATUMS A, B AND D TO BE DETERMINED AT DATUM PLANE H.

4. DIMENSIONS TO BE DETERMINED AT SEATING PLANE C.

5. THIS DIMENSION DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED THE UPPER LIMIT BY MORE THAN 0.08 mm AT MAXIMUM MATERIAL CONDITION. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT, MINIMUM SPACE BETWEEN PROTRUSION AND ADJACENT LEAD SHALL NOT BE LESS THAN 0.07 mm.

6. THIS DIMENSION DOES NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25 mm PER SIDE. THIS DIMENSION IS MAXIMUM PLASTIC BODY SIZE DIMENSION INCLUDING MOLD MISMATCH.

/7. EXACT SHAPE OF EACH CORNER IS OPTIONAL.

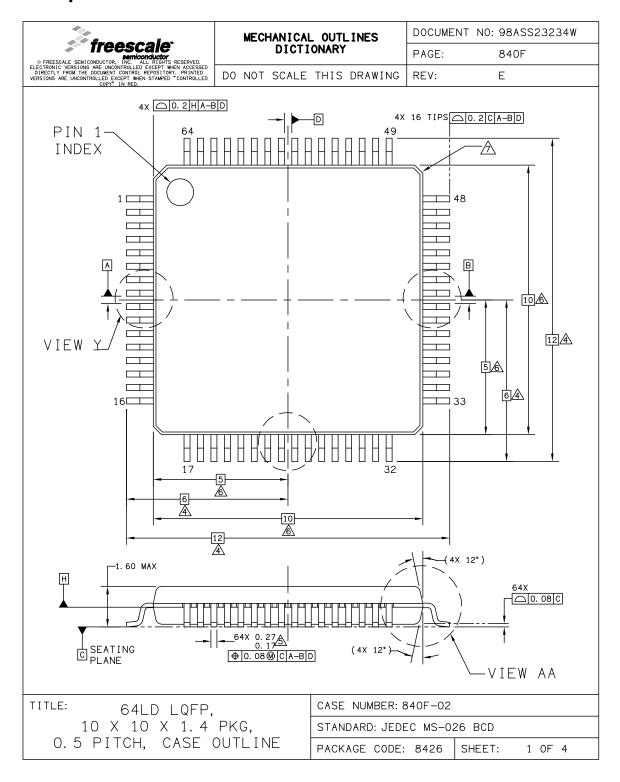

/8. THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.1 mm AND 0.25 mm FROM THE LEAD TIP.

Revision History

4 Revision History

This section lists major changes between versions of the MCF51JM128 Data Sheet document.

Table 23. Changes Between Revisions

Revision	Description
1	Updated features list Updated the figures Typical Low-side Drive (sink) characteristics – High Drive (PTxDSn = 1), Typical Low-side Drive (sink) characteristics – Low Drive (PTxDSn = 0), and Typical High-side Drive (source) characteristics – High Drive (PTxDSn = 1) Added the figure Typical High-side Drive (source) characteristics – Low Drive (PTxDSn = 0) Updated the table Supply Current Characteristics Updated the table Oscillator Electrical Specifications (Temperature Range = -40 to 105×C Ambient) Updated the table SPI Electrical Characteristic, DC Characteristics
2	Updated the table Orderable Part Number Summary, DC Characteristics, and Supply Current Characteristics
3	Updated the table Orderable Part Number Summary, MCG Characteristics, SPI Characteristics, and Supply Current Characteristics Changed V _{DDAD} to V _{DDA} , V _{SSAD} to V _{SSA} Updated the table Device comparison

Information in this document is provided solely to enable system and software implementers to use Freescale Semiconductor products. There are no express or implied copyright licenses granted hereunder to design or fabricate any integrated circuits or integrated circuits based on the information in this document.

Freescale Semiconductor reserves the right to make changes without further notice to any products herein. Freescale Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Freescale Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation consequential or incidental damages. "Typical" parameters that may be provided in Freescale Semiconductor data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals", must be validated for each customer application by customer's technical experts. Freescale Semiconductor does not convey any license under its patent rights nor the rights of others. Freescale Semiconductor products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Freescale Semiconductor product could create a situation where personal injury or death may occur. Should Buyer purchase or use Freescale Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold Freescale Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Freescale Semiconductor was negligent regarding the design or manufacture of the part.

RoHS-compliant and/or Pb-free versions of Freescale products have the functionality and electrical characteristics as their non-RoHS-compliant and/or non-Pb-free counterparts. For further information, see http://www.freescale.com or contact your Freescale sales representative.
